

I claim:

1 1. A watch case comprising a circular watch body
2 formed with two opposite pairs of mutually parallel transversely
3 spaced lugs lying along secants to said body, each of said lugs
4 having radiused free ends lying along circular arc segments
5 concentric with said body, said body having toroidal segments
6 between said pairs of lugs and between the lugs of each pair,
7 said body being curved in a longitudinal median plane between the
8 lugs of said pairs so as to have a concave curvature on a bottom
9 side of said body adapted to conform to a wrist of a wearer and a
10 convex curvature on a top of said body, said top of said body
11 receiving an outwardly convex crystal conforming to a segment of
12 a sphere and flush along an edge of said crystal with a circular
13 frame formed on said body and merging continuously into upper
14 surfaces of said lugs.

1 2. The watch case defined in claim 1, further
2 comprising a crown projecting laterally from one of said toroidal
3 segments centrally thereof.

1 3. The watch case defined in claim 2, further
2 comprising at least one button projecting laterally from said one
3 of said toroidal segments.

1 4. The watch case defined in claim 2, further
2 comprising two buttons projecting laterally from said one of said
3 toroidal segments and equally spaced to opposite sides of said
4 crown, said buttons being radiused and having free extremities
5 lying along a circular arc centered on said body.
